The 8020 Strategy: \$5M Prop Trader's Phone-Based System

Summary of the video "COPY This Prop Firm Simple Trading Strategy with 65% Win Rate (\$5+ Million Payouts)" by Chart Fanatics.

Okala, a prop firm trader with \$5M+ in payouts, reveals his 8020 strategy—a mean-reversion system based on NASDAQ price levels (80 and 20 decimals) combined with three entry structures (fork, H-pattern, cross-section) and repair candle magnets. Trades on 10-minute and 200-second charts with 10-point stops, 15-point first take-profits, and a 70% win rate, executable entirely from a phone.

Core Strategy Framework

8020 Strategy Overview

The 8020 strategy is a NASDAQ-focused mean-reversion system named after the last two digits of price levels. For example, at 25,680 the trader watches the 80 level; at 25,620 the 20 level. These levels are where price consistently reacts, making them primary entry and exit zones.

Two Timeframe Setup

Okala uses a 10-minute chart for overall market structure and a 200-second chart (one-third of 10 minutes) for precise entries. The 200-second breaks down the 10-minute candle into three equal parts, allowing granular entry identification while maintaining structural context.

Risk Management: 10-Point Stop

Every trade uses a fixed 10-point stop-loss. If price moves 10 points against the entry, the trader exits. This discipline reflects the principle that being wrong by 10 points usually means being wrong by 50-100 points, so early exit prevents larger losses.

Multi-Contract Position Sizing

Okala trades multiple contracts per entry rather than single contracts. At the first 15-point profit target, he covers initial risk by taking 1-2 contracts off. Remaining contracts are trailed to break-even, then allowed to run for larger moves. Risk per trade stays static in points; position size increases when the trader feels 'hot.'

Trading Hours and Volatility Windows

Okala primarily trades the New York open (9:30 AM ET) when volatility and variance are highest, giving his statistical edge the best conditions. He avoids the lunch hour (11 AM–1 PM) when the market is choppy and lacks directional bias, and stays out of slow trending or choppy conditions where the edge breaks down.

Three Entry Structures

Fork Setup (Mean Reversion Long)

A fork forms after a strong downmove when price puts in a long-wick, small-body candle (the 'initiation candle'). The next candle tests the low but doesn't break it, then makes a higher high. Entry is on this higher-high candle, targeting the previous low. This catches late shorts being squeezed out.

H-Pattern Setup (Continuation Short)

An H-pattern forms when price bounces off a level (e.g., 20), misses a reversal entry, then makes a strong move into the opposite level (e.g., 80) with a long wick. Price then rolls over and builds a lowercase-H shape. Entry is on the rollover or cross-section test, targeting continuation lower.

Cross-Section Entry (Structural Confluence)

A cross-section is where two breakdown candles intersect. When price retests this exact intersection point (especially at a level like 20 or 80), it provides a high-confluence entry. Cross-sections work on any timeframe and can be used for both longs and shorts depending on market structure.

Repair Candle & Magnet Concept

Repair Candle Definition

A repair candle is one that opens and moves in one direction (e.g., down) with no wick on the opposite side (e.g., no top wick). This means no participants entered at higher prices; all their limit orders remain unfilled above or below the candle, creating a 'magnet' for price to return to.

Using Repair Candles as Targets

Repair candles serve as take-profit magnets. If a fork or H-pattern entry is taken, the repair candle from a prior move becomes a target where price is likely to revert. This allows traders to size into entries more aggressively (taking more than 15 points on TP1) because the magnet provides high-confidence exit.

Trader Profile & Development

Career Payouts & Performance

Okala has earned over \$5 million in total payouts from prop trading. In 2025 alone, he made \$3 million; in January 2026, he made \$200,000. All of this was achieved trading from his phone while working as an electrician for seven years, proving the strategy's portability and consistency.

Development Process: Screen Time & Replay

Okala developed the 8020 strategy through 6–12 hours daily of chart analysis while working. He combined live market observation with nightly market replay sessions, gradually identifying which levels (80, 20) and structures (fork, H, cross-section) repeated across NASDAQ price action. This iterative learning built his edge over years.

Phone-Based Trading Constraint

As an electrician, Okala could not use orderflow, indicators, or desktop setups. He adapted by developing a pure price-action strategy readable on a phone screen. This constraint forced simplicity and clarity, ultimately creating a more portable and teachable system than complex indicator-based approaches.

Trading Discipline & Common Pitfalls

Overtrading & Entry Discipline

The 8020 strategy generates many entries daily, tempting traders to take subpar setups. Okala warns that taking entries that miss one criterion (e.g., no level tap, no fork low test) leads to losses. The best entries combine all elements: level, structure, and candle pattern. Overtrading is the most common failure mode.

No Fixed Trade Limit; Condition-Based

Rather than a hard rule like 'three trades per day max,' Okala uses market conditions. If the market is 'hot' and providing clear setups with all criteria met, he steps on the gas and takes more trades. If choppy or slow, he reduces activity. This requires honest self-assessment of whether entries are genuine or forced.

Consistency Rules in Prop Firms

Prop firms often enforce consistency rules (e.g., daily profit must stay within a range). A \$3,000 day when average is \$300–600 can violate this and jeopardize the payout. Okala emphasizes knowing your firm's rules and managing position size accordingly, especially when letting runners go.

Live Trading Examples

Live Example 1: Repair + Cross-Section Long

Okala identified a repair candle (no top wick) and placed a limit order above it, risking 10 points to make 28 points. Price tapped the repair, reversed, and he entered long at the cross-section of two breakdown candles. The trade hit 15-point TP1 with minimal drawdown, then continued higher, capturing additional points.

Live Example 2: H-Pattern Short with Multiple Adds

Price formed an H-pattern into the 80 level. Okala entered short at a repair candle, hit 15-point TP1, moved to break-even, then added two more contracts on a second repair entry. The position ran down 25+ points total, capturing the full H continuation. He added to winners when the setup remained valid.

Live Example 3: 80 Level Cross-Section Long

Price tested the 80 level and a previous untested cross-section simultaneously (double confluence). Okala entered long with minimal drawdown, hitting 15-point TP1 with no adverse movement. The trade demonstrated how stacking confluences (level + structure) creates near-zero-risk entries.

Notable quotes

I couldn't use orderflow. I couldn't use indicators. So I had to adapt to using just what I see. — Okala

If you're hot, step on the gas. If the market is hot and the model gives you entries and you're seeing it clearly, make your money. — Okala

The best entry will always be off the core principles and mixing everything together into one great entry where you can have that 10-point stop. — Okala

Action items

Study NASDAQ price action on 10-minute and 200-second charts; identify the 80 and 20 levels (last two digits of price).

Backtest the three entry structures (fork, H-pattern, cross-section) on historical charts; track how often price reacts at these levels.

Paper-trade the 8020 strategy during New York open hours (9:30 AM ET) to build pattern recognition without risk.

Identify repair candles (no wick on one side) in your charts; mark them as magnets and note where price reverts to fill unfilled orders.

Set a fixed 10-point stop and 15-point first take-profit on all entries; track your win rate and average profit per trade.

Avoid trading during lunch hour (11 AM–1 PM ET) and slow/choppy market conditions; only trade when all entry criteria are met.

Use multi-contract position sizing: take 1–2 contracts off at TP1 to cover risk, move remaining to break-even, trail the rest.

Review your prop firm's consistency rules and daily profit variance limits; size positions accordingly to avoid payout denials.

Record your own live trades and review them nightly using market replay; identify which setups worked and which you forced.
